

Generic Challenge

- Our {devices, components, systems} in our target environment (in future technology X?) see upset rate A
- Unmitigated we see the systems we want to build will have FIT rate B
- We need to achieve FIT rate C
- With current state of the art, it requires overhead D to achieve FIT rate C.
- This is bad for reasons Y, Z.....
- If we could reduce the overhead from D to E, many great things will occur.
 - *(explain how great things increase the spread of happiness, wealth, freedom, democracy, and health)*
